### ZAMONAVIY TA'LIMNI RIVOJLANTIRISHNING DOLZARB MUAMMOLARI

**Usmonaliev Xusniddin Murodjon o'g'li**  
O'zbekiston davlat jahon tillari universiteti

#### ANNOTATSIYA

Ushbu maqola zamonaviy ta'limni rivojlantirishning eng dolzarb muammolarini tushuntirishga bag'ishlangan. Ular batafsil tahlil qilinadi va muallif nuqtai nazaridan baholanadi va muvofiq yechimlar taqdim etiladi.

**Kalit so'zlar:** Ta'lim, ta'limni modernizatsiya qilish, ta'limni davlat tomonidan qo'llab-quvvatlash, oliy kasbiy ta'limni innovatsion rivojlantirish.

In the modern world, education plays a very important role in determining the social status of an individual, in the development and reproduction of the social structure of society, in maintaining social status, order and stability, and in exercising social control. Moreover, being a factor in the reproduction of the socio-professional structure of society, education is one of the main and effective channels of social mobility. The quality of labor resources, and consequently, the state of the economy as a whole, directly depends on the level of education. So, it was by modernizing the education system that Japan was able to achieve a major breakthrough in the economic sphere.

Therefore, today, quality education is beneficial not only for an individual, becoming more competitive in the labor market, but also for society as a whole, because it helps to provide the country with highly skilled workers. And this means an increase in labor productivity, the introduction of new technologies, and an advance to the forefront in social development.

Solving the problem of improving the quality of education, and in particular higher education, today there is an intensive search and introduction of innovative forms and methods of teaching. This allows you to conduct training online, increase students' interest in the discipline being studied, teach them how to acquire new sociological knowledge, and form important social skills. The introduction of new methods and forms of conducting lectures and seminars, stimulates students' interest in the subject being studied, which affects the efficiency of its mastering, approximates by modeling, analogies, imitations, solving educational problems to real practice, and thereby eliminates a gap in the lack of practical skills graduates, which makes them more competitive in the modern labor market.

In modern educational conditions in a number of preschool institutions there is an increasing interest in the problem of learning and development of children of younger preschool age, as an important "sensitive" period of preschool childhood, and therefore there is an update of educational resources in this area. An important place in the issue of teaching younger preschoolers is choreography, as an effective direction in the physical, moral and aesthetic development of children at this age stage. The development of education occurs in a difficult situation. The activities of educational institutions are destabilizing by factors, among which the main ones are:

- social and economic instability in society,
- an acute shortage of funds due to the crisis in the economy;
- incomplete regulatory framework in the field of education;
- systematic non-compliance with educational legislation.

Poor financing is one of the main causes of crisis situations in the education system. In general, the need of educational institutions for financial resources is provided at the expense of the budgets of all levels of less than a quarter. The trend towards a reduction in real allocations for educational needs remains. At current prices, they have decreased by about 5 times, which in comparable prices is more than twentyfold.

State educational institutions and other organizations of the education system due to the lack of budget funds to pay for heating, electricity and other utilities are disconnected from life support systems in violation. Not all the provisions of the legislation in the field of education are reflected in the relevant regulatory legal acts of the executive authorities, which creates difficulties in the implementation of these provisions. A particular problem is the creation of effective mechanisms for monitoring the

implementation of legislation, the protection of the rights of subjects of the educational process, and compliance with state guarantees in the field of education.

One of the problems of ensuring the activities of higher educational institutions and secondary specialized educational institutions is strengthening at the federal level the coordination of the activity of sectoral systems of higher and so, we believe that the use of electronic textbooks and distance learning technologies is very promising. It is necessary to train students to find information in the electronic Internet, to increase the level of information competence of the student, to assess his understanding of the role of information in the outside world; to give theoretical knowledge and ideas necessary for informatics and information technologies, information and reference programs, etc. The main forms of self-organization of students' educational activities at the university are traditional essays, tasks for preparing for seminars, term papers and projects, the work of the student scientific society, certification works of bachelor, specialist and master.

**An effective form of independent work of students is teaching and research work, which contributes to:**

- activization of cognitive activity, actualization and integration of theoretical knowledge and research skills of students;
- the formation of the students' scientific outlook;
- systematization of research knowledge, skills and the formation of a technological approach to the organization of educational and cognitive activity;
- formation of professional self-determination of future specialists.

**One of the distinguishing features of the modern education system is the transition from the state to the state-public administration of education. The essence of state-public administration is to unite the efforts of the state and society in solving the problems of education. In accordance with the Governmental Program, it is planned to develop mechanisms for improving interaction and coordination of the activities of state authorities of the Republic, state authorities of the constituent entities of the countries, local governments, associations of the educational system and public organizations for the development of the education system as a single complex. This task is due to the presence of problems in the management of the educational system in the Republic. These include:**

- the fragmentation of joint activities of society,
- the education system and the media to create and disseminate educational, educational,
- scientific and educational programs,
- broadcasts and other materials;
- imperfect forms and insufficient activation of the participation of professional associations and associations of educational institutions,
- pedagogical and scientific workers,
- parents (legal representatives) and public organizations in the implementation of state policy in the field of education;
- the practical absence of the forms and methods of development of students' self-government;
- the underdevelopment of the legal framework for the relationship of performers of educational services,
- students and their parents (legal representatives).

In this paper, a number of problems of modern education were considered. I would like to conclude that we need an active search for modern social and pedagogical technologies for the development of education. The previous traditional position - the expectation of instructions from above - is unlikely to be successful today. The problem is to study the needs of the subjects of the educational process and create favorable conditions for their satisfaction. In the end, I want to emphasize that for us it is the main goal to intensively work out all the necessary aspects of the balanced development of our country, mainly including the field of education. I also think that it would be more correct if those universities that work in the regions, cooperate with the largest enterprises of the regions, and together with them promote research and development, whose graduates associate their future with the future, would receive priority support where they live and learn.
